INTRODUCTION

This report documents the methodologies used, and presents the findings of, an aircraft noise assessment that was performed to evaluate the additional aircraft operations forecast with the proposed South Airport Cargo Center (SACC) project (i.e., the Proposed Project) at Ontario International Airport (ONT). **Figure 1** is an aerial photograph of ONT. As shown, ONT has two parallel east-west runways. Runway 8L-26R, the northern runway, is 12,197 feet in length. Runway 8R-26L, the southern runway, is 10,200 feet in length. In addition to aircraft arrivals and departures on the runways resulting in noise, aircraft engine run-ups are also performed at ONT. Run-ups are routine aircraft engine tests that are performed on an aircraft engine(s) following maintenance. The potential for noise impacts resulting from additional SACC-related runups was also evaluated.

The sound (i.e., noise) levels presented in this report represent Community Noise Equivalent Levels (CNELs) expressed in decibels (dB) on the “A”-weighted scale dB(A). Use of this weighting accounts for the relative loudness of sounds as they are perceived by the human ear. CNELs are single numbers that represent the average sound level over a 24-hour period with a penalty of 5 dB(A) added for each noise event between the hours of 7 p.m. and 10 p.m. and a penalty of 10 dB(A) added to each event between the hours of 10 p.m. and 7 a.m. The CNEL metric is the predominant metric used for noise assessments in the state of California.

METHODOLOGY

Aircraft noise levels were derived using Version 3d of the Federal Aviation Administration’s (FAA’s) Aviation Environmental Design Tool (AEDT), the current version of the computer model when the analysis was performed. Since then, the FAA released a more updated version of AEDT (Version 3e). A review of the new features of Version 3e indicate that the updated model would not provide aircraft noise results that would differ from those derived using Version 3d.

AEDT uses airport-specific information and aircraft fleet databases. The aircraft fleet database contains more than 3,000 aircraft (airframe and engine combinations). For the evaluation of noise, AEDT contains parameters from the International Civil Aviation Organization’s (ICAO’s) Aircraft Noise and Performance Database and the European Organization for the Safety of Air Navigation’s (EUROCONTROL’s) base of aircraft data. The fleet database also contains noise versus power versus distance acoustic data augmented by a database of spectral characteristics. The noise versus power versus distance data represent the aircraft source noise level for a given operational mode (i.e., arrival, departure) and power setting (runups) at a range of slant distances from an aircraft to account for acoustic propagation through the atmosphere. Arrivals and departures generate different types of aircraft noise. For departures, noise from the engine is typically dominate while airframe noise is typically dominate for arrivals.¹

The airport-specific data used by AEDT include the following:

- Number of aircraft operations by aircraft type – referred to as the aircraft fleet mix.
- Time of day in which the operations occur – for the purpose of deriving CNELs.
- Departure destinations by aircraft type – this information is used to assign “stage lengths” to aircraft departures to account for the lower altitude of departures flying longer distances because the necessary additional fuel adds to the weight of an aircraft.

DATE: May 2022

- Runway and aircraft track usage – defines to what runway(s) and flight tracks (i.e., paths) aircraft arrivals and departures are assigned.
- Location and frequency of engine runups – performance checks may be performed at thrust settings from idle to full power.

ENVIRONMENTAL SETTING

This section describes the “Baseline Condition” by which the Proposed Project was evaluated. Development of the Baseline Condition, which represents a hybrid 2019/2020 base year, is described in the Ontario International Airport Authority’s (OIAA’s) recently published Draft Supplemental Environmental Impact Report (SEIR) for the rehabilitation of ONT’s Runway 8R-26L.² As documented in the Runway 8R-26L SEIR, the hybrid base year was developed because in 2020 there was a major decrease in passenger enplanements and commercial operations at ONT due to the COVID-19 pandemic. The Baseline Condition contours from the Runway 8R-26L SEIR were also used to represent the Baseline Condition contours for the evaluation of the Proposed Project that is the subject of this report (i.e., the SACC).

Assessments of aircraft noise are performed for annual average daily conditions (i.e., annual operations divided by the number of days in a year). The number of annual and average day operations is provided in **Table 1**. The average day aircraft fleet mix, the number of arrivals and departures by runway and time of day, the number of departures by stage length, the number of arrivals and departures by flight track, and the number of aircraft engine runups are provided in **Attachments A, B, C, D, and E** of this report, respectively. The arrival and departure flight tracks that were modeled in the AEDT are illustrated on **Figure 2**.

Table 1: Aircraft Operations-Baseline Condition

Year	Number of Aircraft Operations	
	Annual	Average Day
2019/2020	106,026	290

Figure 3 illustrates the land uses in the vicinity of ONT overlaid with the Baseline Condition CNEL 65, 70, and 75 dB(A) aircraft noise contours. As shown, the CNEL 65 dB(A) contour extends approximately 2.75 miles east and approximately 0.75 miles west of ONT’s runways. East of the airport, the land uses are primarily commercial and manufacturing/production, land uses that are compatible with aircraft noise. While there are residences west of the airport, aircraft noise has been addressed at most of the housing units by the OIAA’s Quiet Home Program.³

Table 2 provides the estimated number of residences (i.e., housing units) and persons within each of the noise contour levels. Notably, the count of residences does not include a residence for which the OIAA has records that the residence was addressed by the Quiet Home Program but does include residences on parcels for which OIAA has identified the parcel is subject to an avigation easement. It is not known at this time if the residences on these parcels were also addressed in the Quiet Home Program so, to be conservative, the residences are included in the residential and population count. The number of persons within the noise

contour intervals was estimated using census block data from the U.S. Census Bureau for the year 2010.⁴ As shown, for the Baseline Condition there are 13 residences and an estimated 59 people residing within the CNEL 65-69 dB(A) contour and no residences/people residing within the CNEL 70+ dBA contour. The area within the CNEL 65+ dB(A) contour was also reviewed to determine if there were any schools, libraries, hospitals, or places of worship exposed to significant aircraft noise. No such land uses exist within the area.

Table 2: Housing Units and Population-Baseline Condition

Housing Units/ Population	65-69 CNEL	70-74 CNEL	75+ CNEL	Total
Housing Units	13	0	0	13
Population	59	0	0	59

Source: Draft SEIR, Rehabilitation of Runway 8R-26L and Associated Airfield Improvements, HNTB, April 2022.

Note: When considering parcels for which the OIAA has no record of the residence(s) being addressed through the Quiet Home Program but for which the parcel is subject to an aviation easement, the number of housing units reduces to 12 and the population reduces to 54 (additional information is provided in the Attachment F of this Aircraft Noise Assessment Report).

NOISE MANAGEMENT AND REGULATIONS

There is a long history of efforts to manage aircraft noise resulting from the aircraft operations at ONT. Section 5 of the Rules and Regulations Manual for ONT⁵, a manual published by the OIAA, addresses aircraft noise mitigation operating procedures and restrictions at the airport. As a result of these efforts, and when weather conditions permit, the following voluntary operational and aircraft restrictions are in place at ONT:

- Touch-and-go operations performed by turbojet and turbofan aircraft are prohibited unless special permission is given to do so.
- From 10 p.m. to 7 a.m., when wind and weather conditions permit, aircraft depart to the east and land to the west. During these nighttime hours, this “Contra Flow” minimizes the level of aircraft noise exposure to the area west of ONT.
- From 10 p.m. to 7 a.m., engine run-ups are prohibited.
- Departures not starting at the end of a runway (referred to as intersection departures) are prohibited except for departures from Runway 8L at Taxiway D and from Runway 26R at Taxiway V. This restriction places aircraft at higher altitudes when passing over residences in the vicinity of the airport.
- When possible, helicopter operators are to use noise abatement arrival and departure flight techniques.

The City of Ontario and San Bernardino County, acting as the OIAA, also encourage the airlines operating at ONT to use quieter aircraft, to re-engine aircraft to meet the most restrictive aircraft engine noise standards established by the FAA, and to retire old/noisier aircraft.

⁴ Year 2010 census data was used to be consistent with the methodology used in preparing the noise analysis for the rehabilitation of ONT’s Runway 8R-26L.

⁵ [ONT Rules and Regulations | Ontario International Airport \(flyontario.com\)](http://flyontario.com)

State

The California Environmental Quality Act (CEQA) requires the disclosure of environmental impacts related to proposed projects and the prevention of significant, avoidable environmental damage. The process informs decision makers and the public about the potential for any environmental impact.

To the extent not prohibited by federal law, Title 21 (Public Works), Division 2.5, Chapter 6 of the California Code of Regulations is applicable to all aircraft and aircraft engines that produce noise within the state of California. Section 5102 of Title 21 establishes CNEL 65 dB(A), as the Airport Noise Standard for an acceptable level of aircraft noise for persons living in the vicinity of an airport. Title 21 also defines that residences are noncompatible with aircraft noise levels at CNEL 65+ dB(A) unless the following conditions are met:

- An aviation easement for aircraft noise has been acquired by the airport proprietor;
- The dwelling unit was in existence at the same location prior to January 1, 1989 and has adequate acoustic insulation to ensure an interior CNEL of 45 dB or less due to aircraft noise in all habitable rooms. However, acoustic treatment alone does not convert residences having an exterior CNEL of 75 dB or greater due to aircraft noise to a compatible land use if the residence has an exterior normally occupiable private habitable area such as a backyard, patio or balcony;
- The residence is a high-rise apartment or condominium having an interior CNEL of 45 dB or less in all habitable rooms due to aircraft noise, and an air circulation or air conditioning system, as appropriate;
- The airport proprietor has made a genuine effort as determined by the department in accordance with adopted land use compatibility plans and appropriate laws and regulations to acoustically treat residences exposed to an exterior CNEL less than 80 d(A)B (75 dB(A)) if the residence has an exterior normally occupiable private habitable area such as a backyard, patio, or balcony) or acquire aviation easements, or both, for the residences involved, but the property owners have refused to take part in the program; or
- The residence is owned by the airport proprietor.

Under the following conditions, public/private schools, hospitals/convalescent homes, and places of worship are also considered to be noncompatible with aircraft noise levels at or above CNEL 65 dB(A):

- Schools of standard construction for which an aviation easement for noise has not been acquired by the airport proprietor, or that do not have adequate acoustic performance to ensure an interior CNEL of 45 dB(A) or less in all classrooms due to aircraft noise;
- Hospitals and convalescent homes for which an aviation easement for noise has not been acquired by the airport proprietor, or that do not have adequate acoustic performance to provide an interior CNEL of 45 dB(A) or less due to aircraft noise in all rooms used for patient care; and
- Places of worship for which an aviation easement for noise has not been acquired by the airport proprietor or that do not have adequate acoustic performance to ensure an interior CNEL of 45 dB(A) or less due to aircraft noise.

Assembly Bill 2776 requires any person who intends to sell or lease residential properties in an airport influence area to disclose that fact to the person buying the property.

Federal

Title 14, Part 150 of the Code of Federal Regulations (14 CFR 150) prescribes the procedures, standards, and methodologies to be used by airport proprietors in developing or updating airport Noise Exposure Maps (NEMs) and airport noise compatibility programs (NCPs). The voluntary studies performed for this purpose are referred to as Part 150 studies. In a Part 150 study, uses of land that are normally compatible and noncompatible around airports are identified and measures to reduce or eliminate the number of noncompatible uses are evaluated. The land uses identified above for which state regulations are applicable (i.e., residences, schools, hospitals, convalescent homes, and places of worship) are also identified in 14 CFR 150 as being noncompatible with aircraft noise unless certain conditions are met (e.g., sound insulation to achieve an interior level of 45 dB(A)). In April of 2016, the FAA published a notice in the Federal Register that an NEM prepared for existing conditions at the time of the submittal (2015) and an NEM for future forecast conditions (2020) complied with all the applicable requirements of 14 CFR 150.⁶

An initial Part 150 study was performed for ONT in the late 1980s and study documents were published in 1990. This initial study resulted in both NEMs and an NCP for the airport. As part of the NCP, the Quiet Home Program was established for ONT to reduce the noncompatible land uses that were exposed to significant aircraft noise. Since that time, more than 1,599 eligible residential structures have been sound insulated and 256 noise sensitive properties acquired with the intent for compatible reuses of the acquired properties.

IMPACTS

This section describes the data used to define the aircraft noise-related environment with the SACC, the thresholds of significance that were used to determine if any land uses for which the thresholds are applicable would be impacted by aircraft noise, and the results of the analysis.

Assessment Data

Because the Proposed Project would not open until the fall of 2024, the aircraft noise assessment representing Phase 1 conditions was performed for the year 2025, when the Project would first be operational for an entire year. In 2025, with the Proposed Project it is forecast that there would be 44 daily cargo-related operations occurring six days a week at ONT. By 2029 (Phase 2 buildout), it is forecast that there would be 66 daily cargo-related operations occurring six days a week.

The average day aircraft fleet mix and number of operations, the number of arrivals and departures by runway and time of day, the number of departures by stage length, the number of arrivals and departures by flight track, and the number of runups with the Proposed Project are provided in **Attachments A, B, C, D, and E** of this report, respectively. **Table 3** provides the total number of annual and average day aircraft operations with the Proposed Project for 2025 and 2029. For comparative purposes, the number of Baseline Condition operations is also provided. As shown, when considering the additional number of operations with the Proposed Project, the number of total average day operations is forecast to increase by 70 and 115 operations in 2025 and 2029, respectively, when compared to the Baseline Condition.

⁶ Volume 81 of the Federal Register, Pages 20048-20049, April 6, 2016.

Table 3: Aircraft Operations-Baseline Condition and Proposed Project

Year	Condition	Annual Operations	Average Day	
			Operations	Increase from Baseline Condition
2019/2020	Baseline	106,026	290	--
2025	Proposed Project	131,354	360	70
2029	Proposed Project	147,714	405	115

Thresholds of Significance

A threshold of significance defines the level of effect above which an impact is considered significant and below which the level is less than significant. For noise, CEQA's Appendix G (an environmental checklist) lists the following applicable questions to be answered in evaluating the potential aviation noise impact of the proposed SACC⁷:

1. *Generation of substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?*

The City of Ontario is currently receiving comments on The Ontario Plan (TOP) 2050 that outlines the City's vision for "a sustained, community-wide prosperity which continuously adds value and yields benefit".⁸ TOP provides land use compatibility standards that are to be used by urban planner to gauge the compatibility of land uses relative to existing and future noise levels. The compatibility guidelines from the TOP 2050 are provided in **Table 4**. Notably, the TOP guidelines are only applicable to new construction of the listed land uses.

Table 4: Ontario Noise Level Exposure and Land Use Compatibility Guidelines

Source: TOP 2050.

^a No special noise insulation required, assuming buildings of normal conventional construction.

^b Acoustical reports will be required for major new residential construction. Conventional construction with closed window and fresh air supply systems of air conditions will normally suffice.

^c New construction should be discouraged. Noise/aviation easements required for all new construction. If new construction does proceed, a detailed analysis of noise reduction requirements must be made, and necessary noise insulation features included.

^d No new construction should be permitted.

2. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

The Airport Noise Standard (CNEL 65 dB(A)) established in Title 21 of the California Code of Regulations was used to evaluate this threshold of significance. The results of the analysis are presented in the following section of this report.

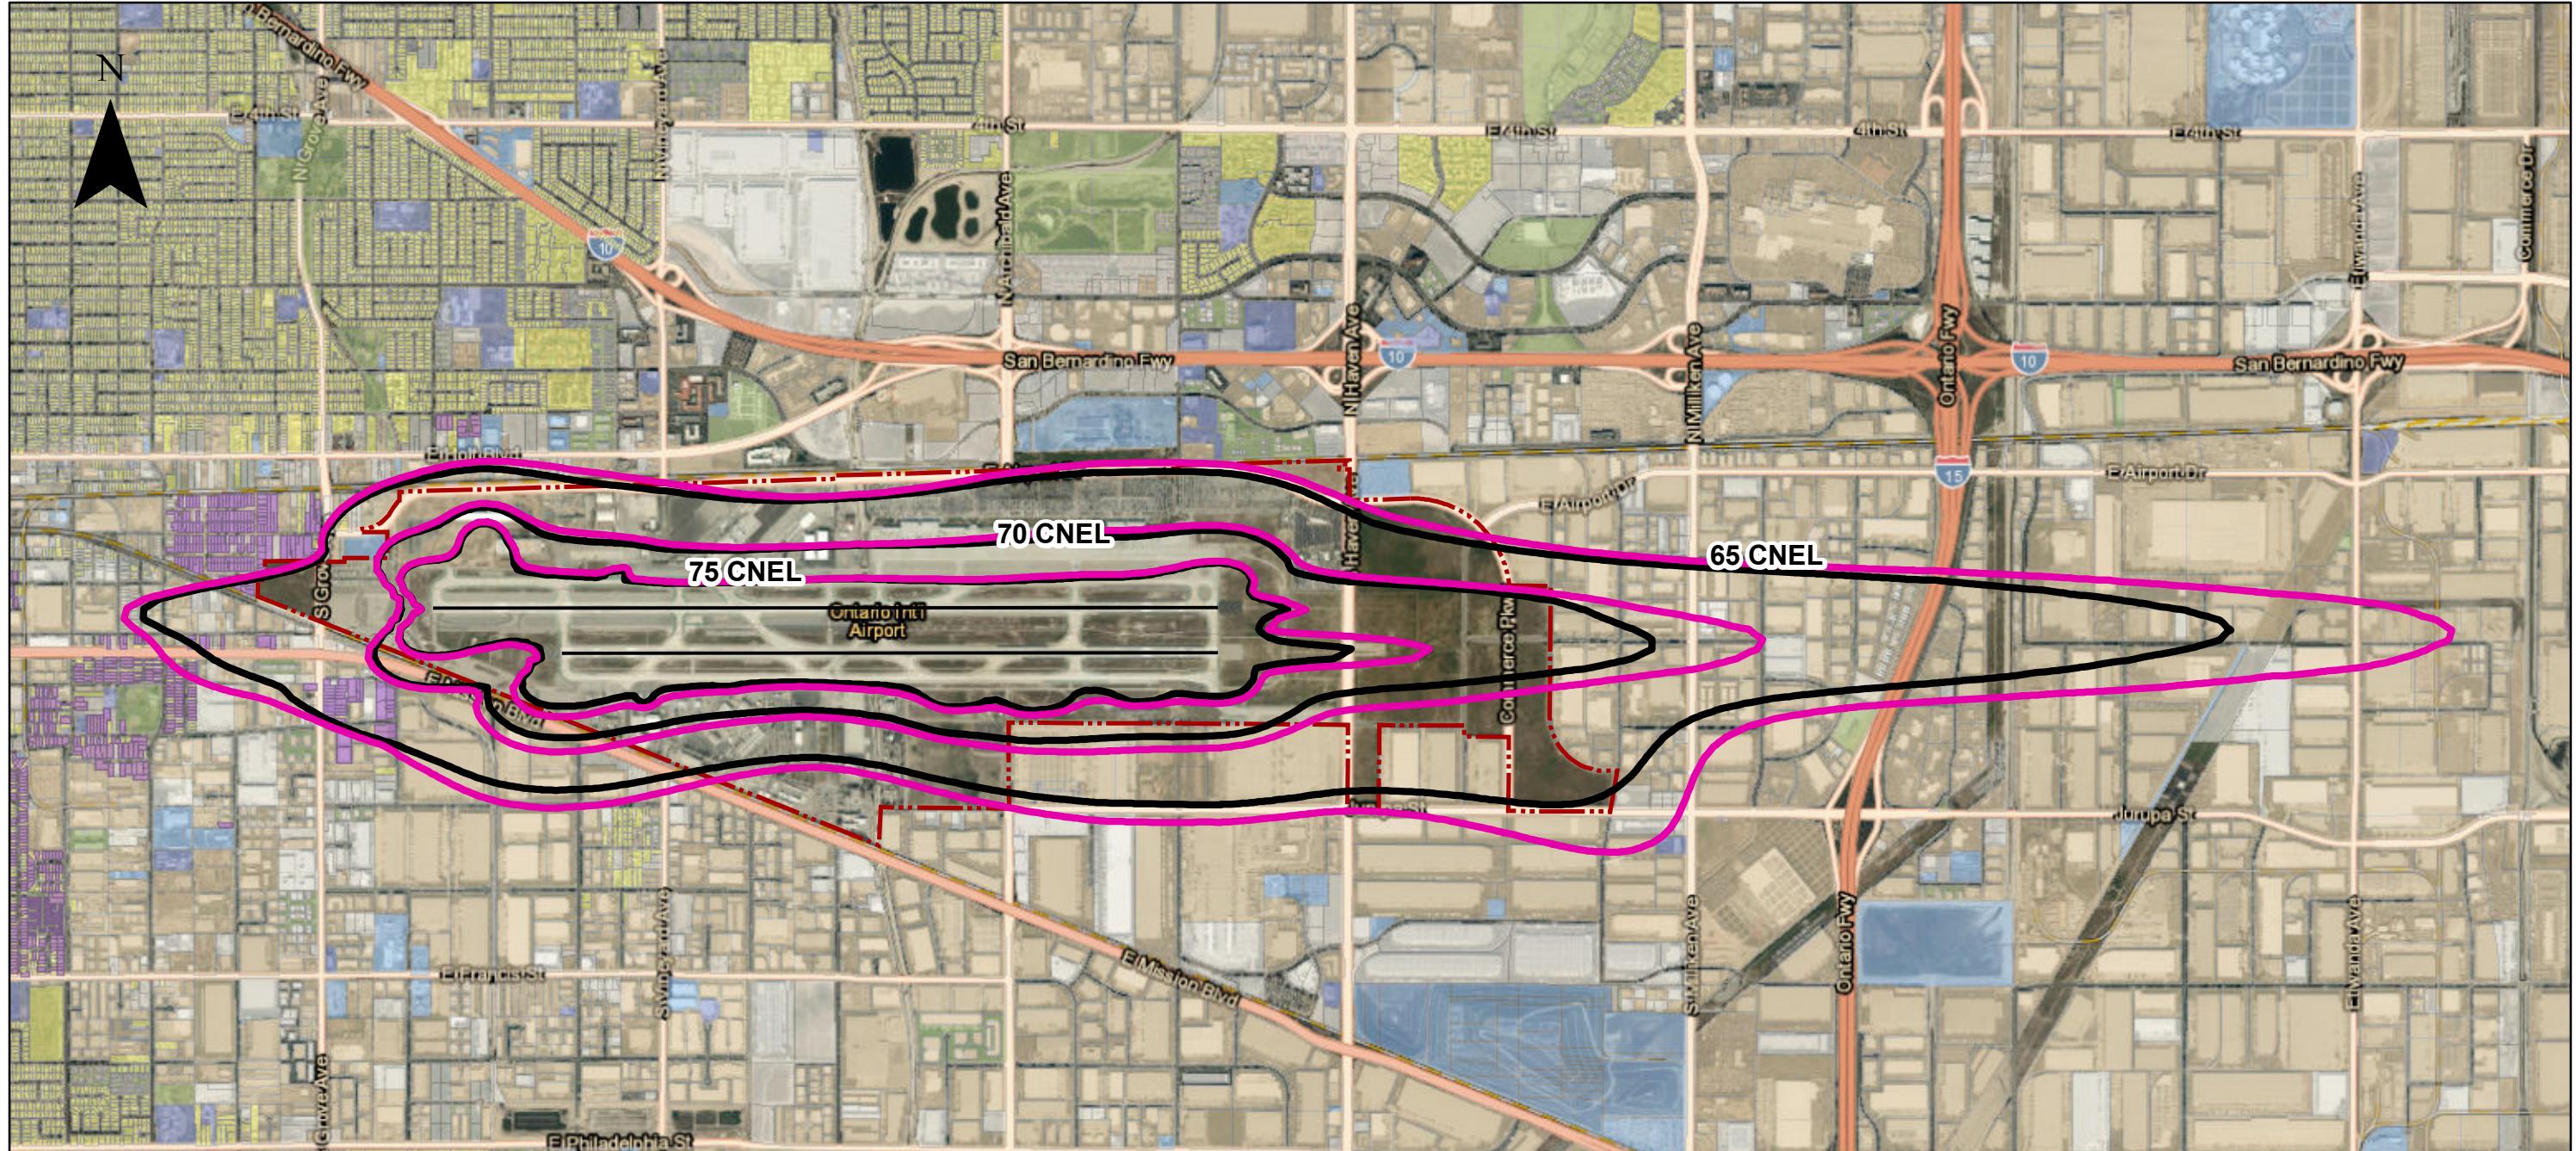

Analysis Results – Proposed Project/Baseline Conditions

As required by CEQA, the analysis results for the Proposed Project were compared to the results for the Baseline Condition and to the thresholds of significance above to indicate whether the Proposed Project would have “no impact”, a “less than significant impact”, a “less than significant impact with mitigation incorporated”, or a “potentially significant impact”.

Changes to Ambient Noise Levels/Exposure to Excessive Noise Levels

The land uses within the year 2025 and 2029 aircraft CNEL 65+ dB(A) noise contour with the Proposed Project and the Baseline Condition are depicted on **Figures 4 and 5**. As shown, between the two contour lines (i.e., the area of change in aircraft noise exposure with the Proposed Project), the land uses are primary commercial, manufacturing/production, and mitigated properties (all residences).⁹ There are also a few unmitigated residences located within the western extent of the area in which aircraft noise would increase with the Proposed Project. As also shown, between the two CNEL 70+ dB(A) contour lines, the land uses are commercial, manufacturing/production, or vacant. The area within the CNEL 65+ dB(A) contour for the Proposed Project was also reviewed to determine if there were any schools, libraries, hospitals, or places of worship that would be exposed to significant aircraft noise. No such land uses exist within the Proposed Project CNEL 65+ dB(A) contour.

⁹ The mitigated properties (all residences) were addressed by the OIAA’s Quiet Home Program.

Table 5 provides the estimated number of housing units and persons within the CNEL 65-69, 70-74, and 75+ dB(A) contours. In the year 2025 with the Proposed Project, it is estimated that there would be four additional residences for which OIAA has no record of the residences being addressed through the Quiet Home Program and 18 persons within the CNEL 65-69 dB(A) contour and no housing units or persons within the CNEL 70+ dB(A) contour when compared to the Baseline Condition. By the year 2029, it is estimated that there would be 15 additional housing units for which the OIAA has no records of the residences being addressed through the Quiet Home Program and 63 additional persons within the CNEL 65-69 dB(A) contour and no housing units or persons within the CNEL 70+ dB(A) contour. Because the OIAA has no records of any of the identified residences being addressed through the Quiet Home Program, the Proposed Project would result in a “potentially significant impact”.

Table 5: Housing Units and Population-Baseline Condition and Proposed Project

Year	Condition	Housing Units/ Population	65-69 CNEL	70-74 CNEL	75+ CNEL	Total
2019/2020	Baseline	Housing Units ^a	13	0	0	13

2025	Proposed Project	Housing Units ^b	17	0	0	17
		Population ^b	77	0	0	77
	<i>Increase with Proposed Project</i>	Housing Units	+4	0	0	+4
		Population	+18	0	0	+18
2029	Proposed Project	Housing Units ^b	28	0	0	28
		Population ^b	122	0	0	122
	<i>Increase with Proposed Project</i>	Housing Units	+15	0	0	+15
		Population	+63	0	0	+63

^a Source: Draft SEIR, Rehabilitation of Runway 8R-26L and Associated Airfield Improvements, HNTB, April 2022.

^b Source: Crawford, Murphy & Tilly, Inc., May 2022.

Note: When considering parcels for which the OIAA has no record of the residences being addressed through the Quiet Home Program but for which the parcel is subject to an aviation easement, the increase in the number of housing units in 2025 with the Proposed Project reduces to three and the population reduces to 14 and in 2029 the number of housing units reduces to 12 and the population reduces to 51 (additional information is provided in Attachment F of this Aircraft Noise Assessment Report).

Analysis Results – Proposed Project/No Action Alternative

As previously stated, to define the significance of the impact of a proposed project, CEQA regulations require future conditions with a proposed project be compared to existing (i.e., Baseline) conditions. Because such a comparison also includes the potential impact that would occur in the future without a project (i.e., the No Project Alternative), a comparison of the Proposed Project and No Action Alternative was performed. Notably, the growth in passenger activity at ONT, which would occur with or without the Proposed Project that is the subject of this report, would result in increases in aircraft operations and aircraft noise.

The average day aircraft fleet mix and number of operations, the number of arrivals and departures by runway and time of day, the number of departures by stage length, the number of arrivals and departures by flight track, and the number of runups with the No Action Alternative are provided in **Attachments A, B, C, D, and E** of this report, respectively. For comparative purposes, **Table 6** provides the total number of

annual and average day aircraft operations with the Proposed Project and No Action Alternatives. As shown, with the No Action Alternative, the number of average day operations is forecast to increase by 32 and 58 operations in 2025 and 2029, respectively, when compared to the Baseline Condition.

Table 6: Aircraft Operations-Proposed Project and No Action Alternative

Year	Condition	Annual Operations	Average Day	
			Operations	Increase from No Action Alternative
2025	Proposed Project	131,354	360	38
	No Action Alternative	117,624	322	--
2029	Proposed Project	147,714	405	56
	No Action Alternative	127,122	348	--

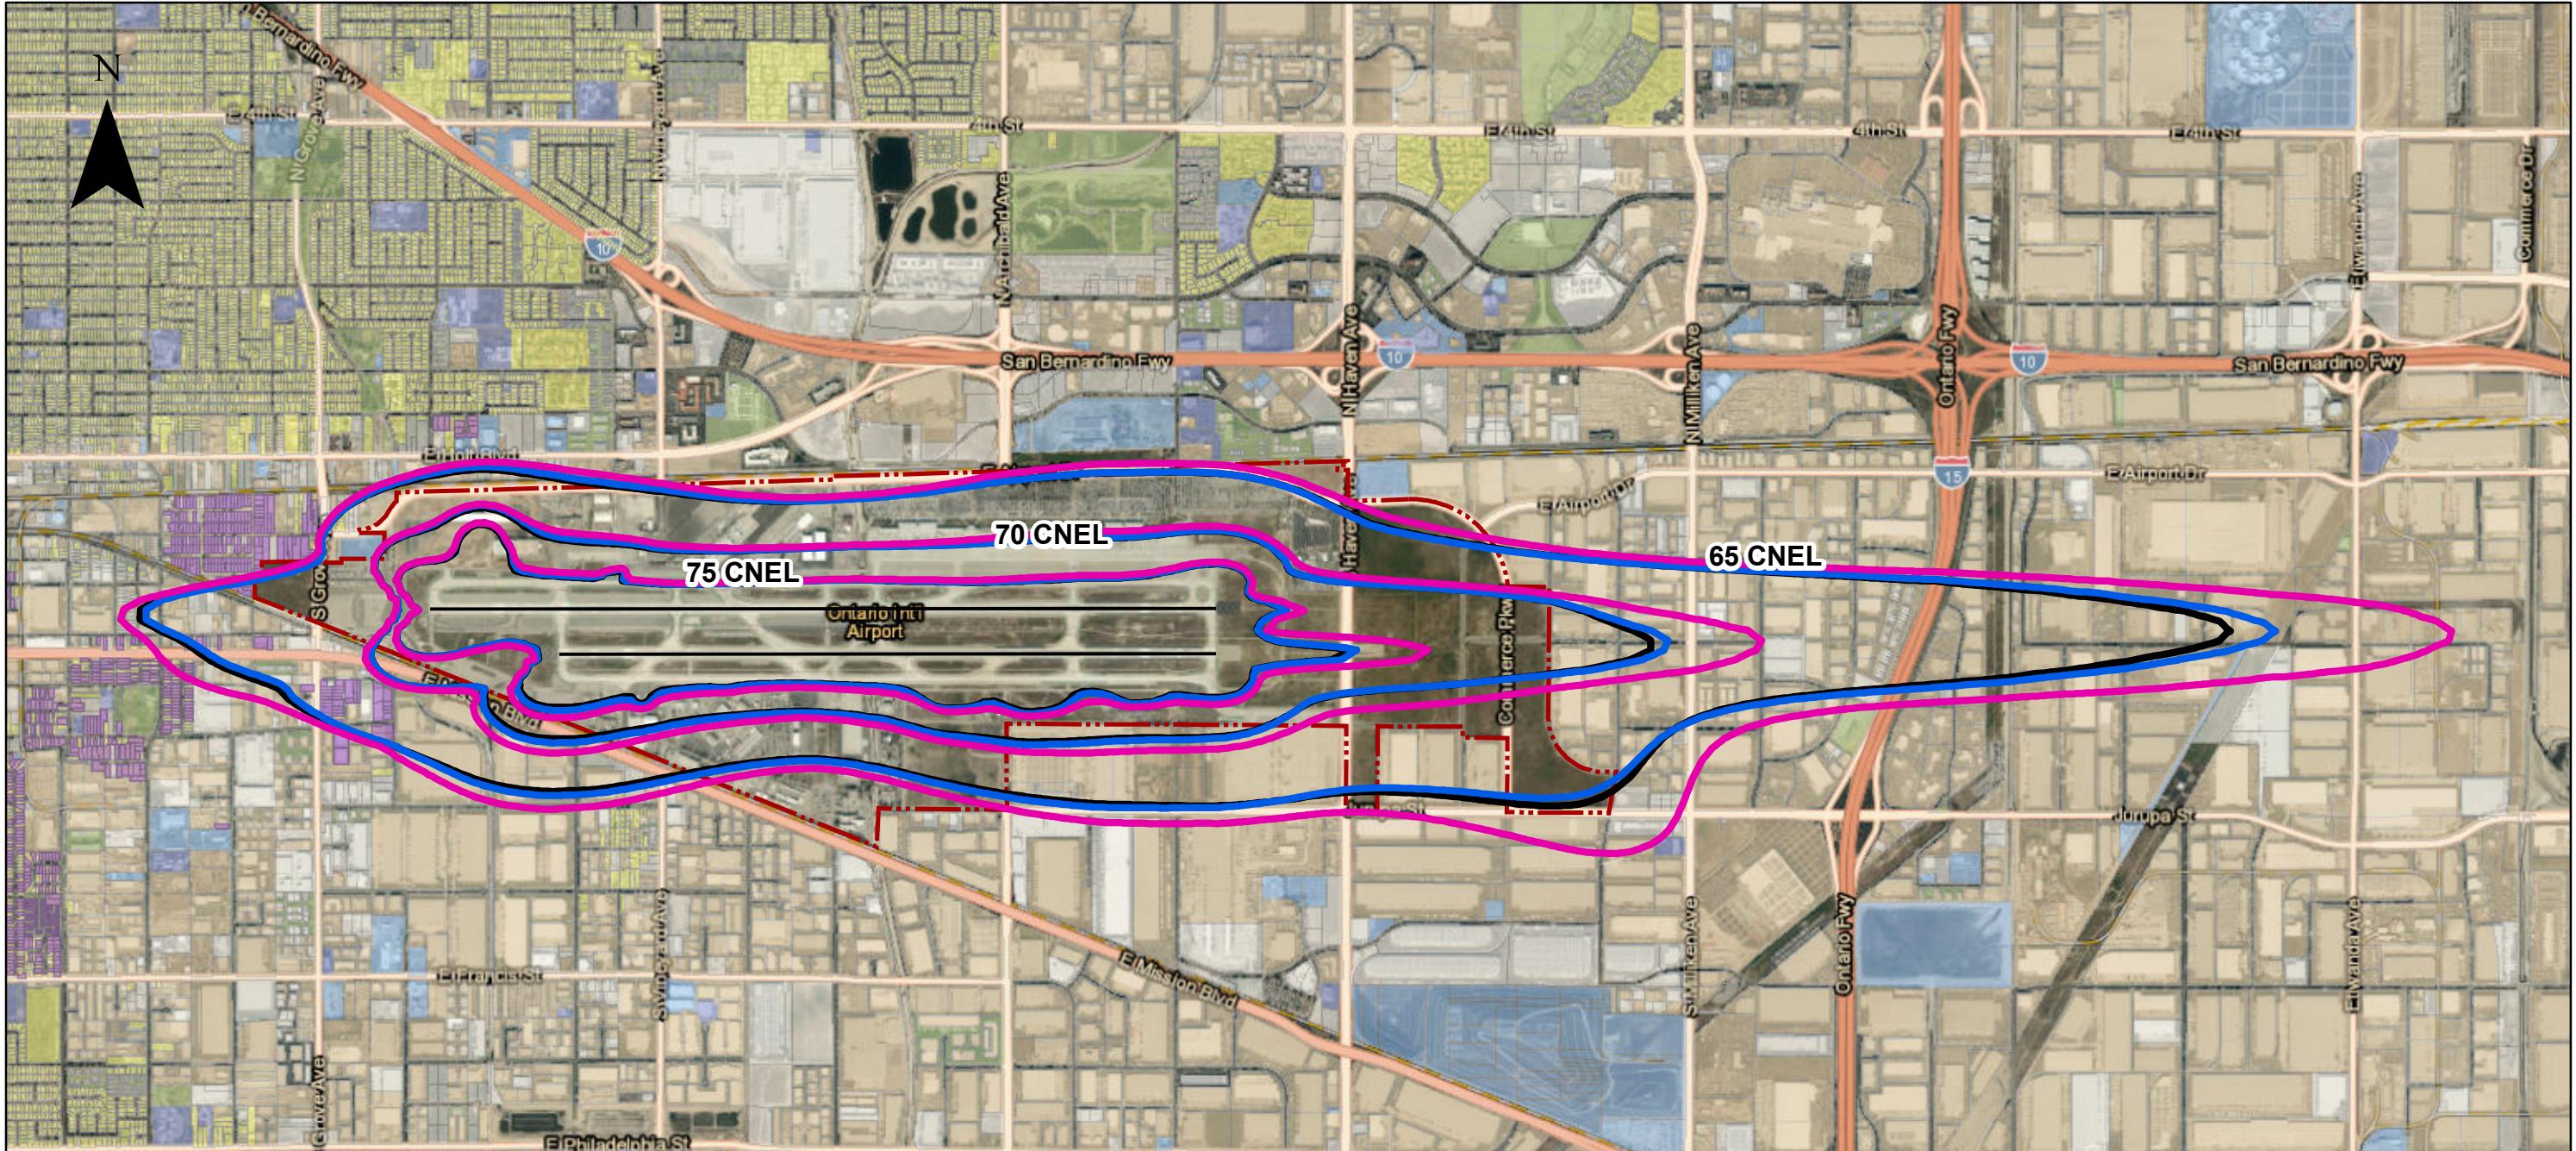

Note: Values reflect rounding.

The land uses within the year 2025 and 2029 aircraft CNEL 65 dB(A) noise contour with the Proposed Project and the No Action Alternative are depicted on **Figures 6 and 7**. As shown, between the two CNEL 65 dB(A) contour lines (i.e., the area of change in aircraft noise exposure with the Proposed Project), the land uses are primary commercial or manufacturing/production and residential. The residences are comprised of mitigated properties¹⁰ and a few unmitigated residences located west of the airport. As also shown, between the two CNEL 70+ dB(A) contour lines, the land uses are commercial, manufacturing/production, or vacant.

Table 7 provides the estimated number of housing units for which the OIAA has no record of the residences being addressed through the Quiet Home Program and the estimated number of people within each of the noise contour levels. As shown, in the year 2025 with the Proposed Project it is estimated that there would be five additional housing units and 23 persons within the CNEL 65-69 dB(A) contour and no housing units or persons within the CNEL 70+ dB(A) contour. By the year 2029 with the Proposed Project, it is estimated that there would be 15 additional residences for which there are no records of the residences being addressed and 63 additional persons within the CNEL 65-69 dB(A) contour. No housing units or persons are within the CNEL 70+ dB(A) contour.

It is notable that there is a minimal change in the CNEL 65 dB(A) contours when comparing Baseline Conditions to forecast No Action conditions for both the year 2025 and 2029. This minimal change is predicted to occur despite a forecast increase in the number of average day aircraft operations (an increase of 38 daily operations in 2025 and an increase of 56 daily operations in 2029). The minimal change is due in large part to a change in the narrowbody jet fleet forecast to arrive and depart ONT. **Table 8** compares the numbers of some of the older, noisier aircraft types (referred to as Stage III aircraft) that are predicted to reach the end of their service life and would therefore be replaced with newer and quieter aircraft (Stage V aircraft). Overall, by the year 2029 it is forecast that approximately 39 percent of the Stage III narrowbody aircraft would be replaced by Stage 3 narrowbody aircraft.

¹⁰ The mitigated properties (all residences) were addressed by the OIAA's Quiet Home Program—a program that provided sound insulation to 1,599 dwellings as of 2016.

Note: When considering parcels for which the OIAA has no record of the residences being addressed through the Quiet Home Program but for which the parcel is subject to an aviation easement, the increase in the number of housing units in 2025 with the Proposed Project when compared to the No Action Alternative reduces to three and the population reduces to 14 and in 2029 the number of housing units reduces to 12 and the population reduces to 51 (additional information is provided in Attachment F of this Aircraft Noise Assessment Report).

Table 8: Aircraft Fleet Mix Changes

CUMULATIVE IMPACTS

As previously stated, the OIAA recently published a Draft SEIR for the rehabilitation of ONT's Runway 8R-26L and associated airfield improvements. These improvements are proposed so that the airfield meets current FAA standards, safety is improved, and the efficiency of the airfield is enhanced. To implement the improvements, temporary runway closures would be required and the only change in the use of the airfield would result from suspension of voluntary restrictions on the use of Contra Flow operations during nighttime hours (10 p.m. to 7 a.m.). Because these voluntary restrictions would not be available when operating only one runway, the Runway 8R-26L Draft SEIR forecasts that there would be a temporary increase in noise exposure to the west of ONT during nighttime hours.

The Runway 8R-26L runway rehabilitation/reconstruction project is scheduled to begin in 2023 and end in 2025, one of the same years for which the SACC was evaluated. To evaluate the impact due to the overlap of the Proposed Project that is the subject of this report and the Runway 8R-26L runway rehabilitation/reconstruction project, a cumulative aircraft noise analysis was performed. As required by CEQA, the cumulative 2025 condition was compared to the Baseline Condition (**Figure 8**).

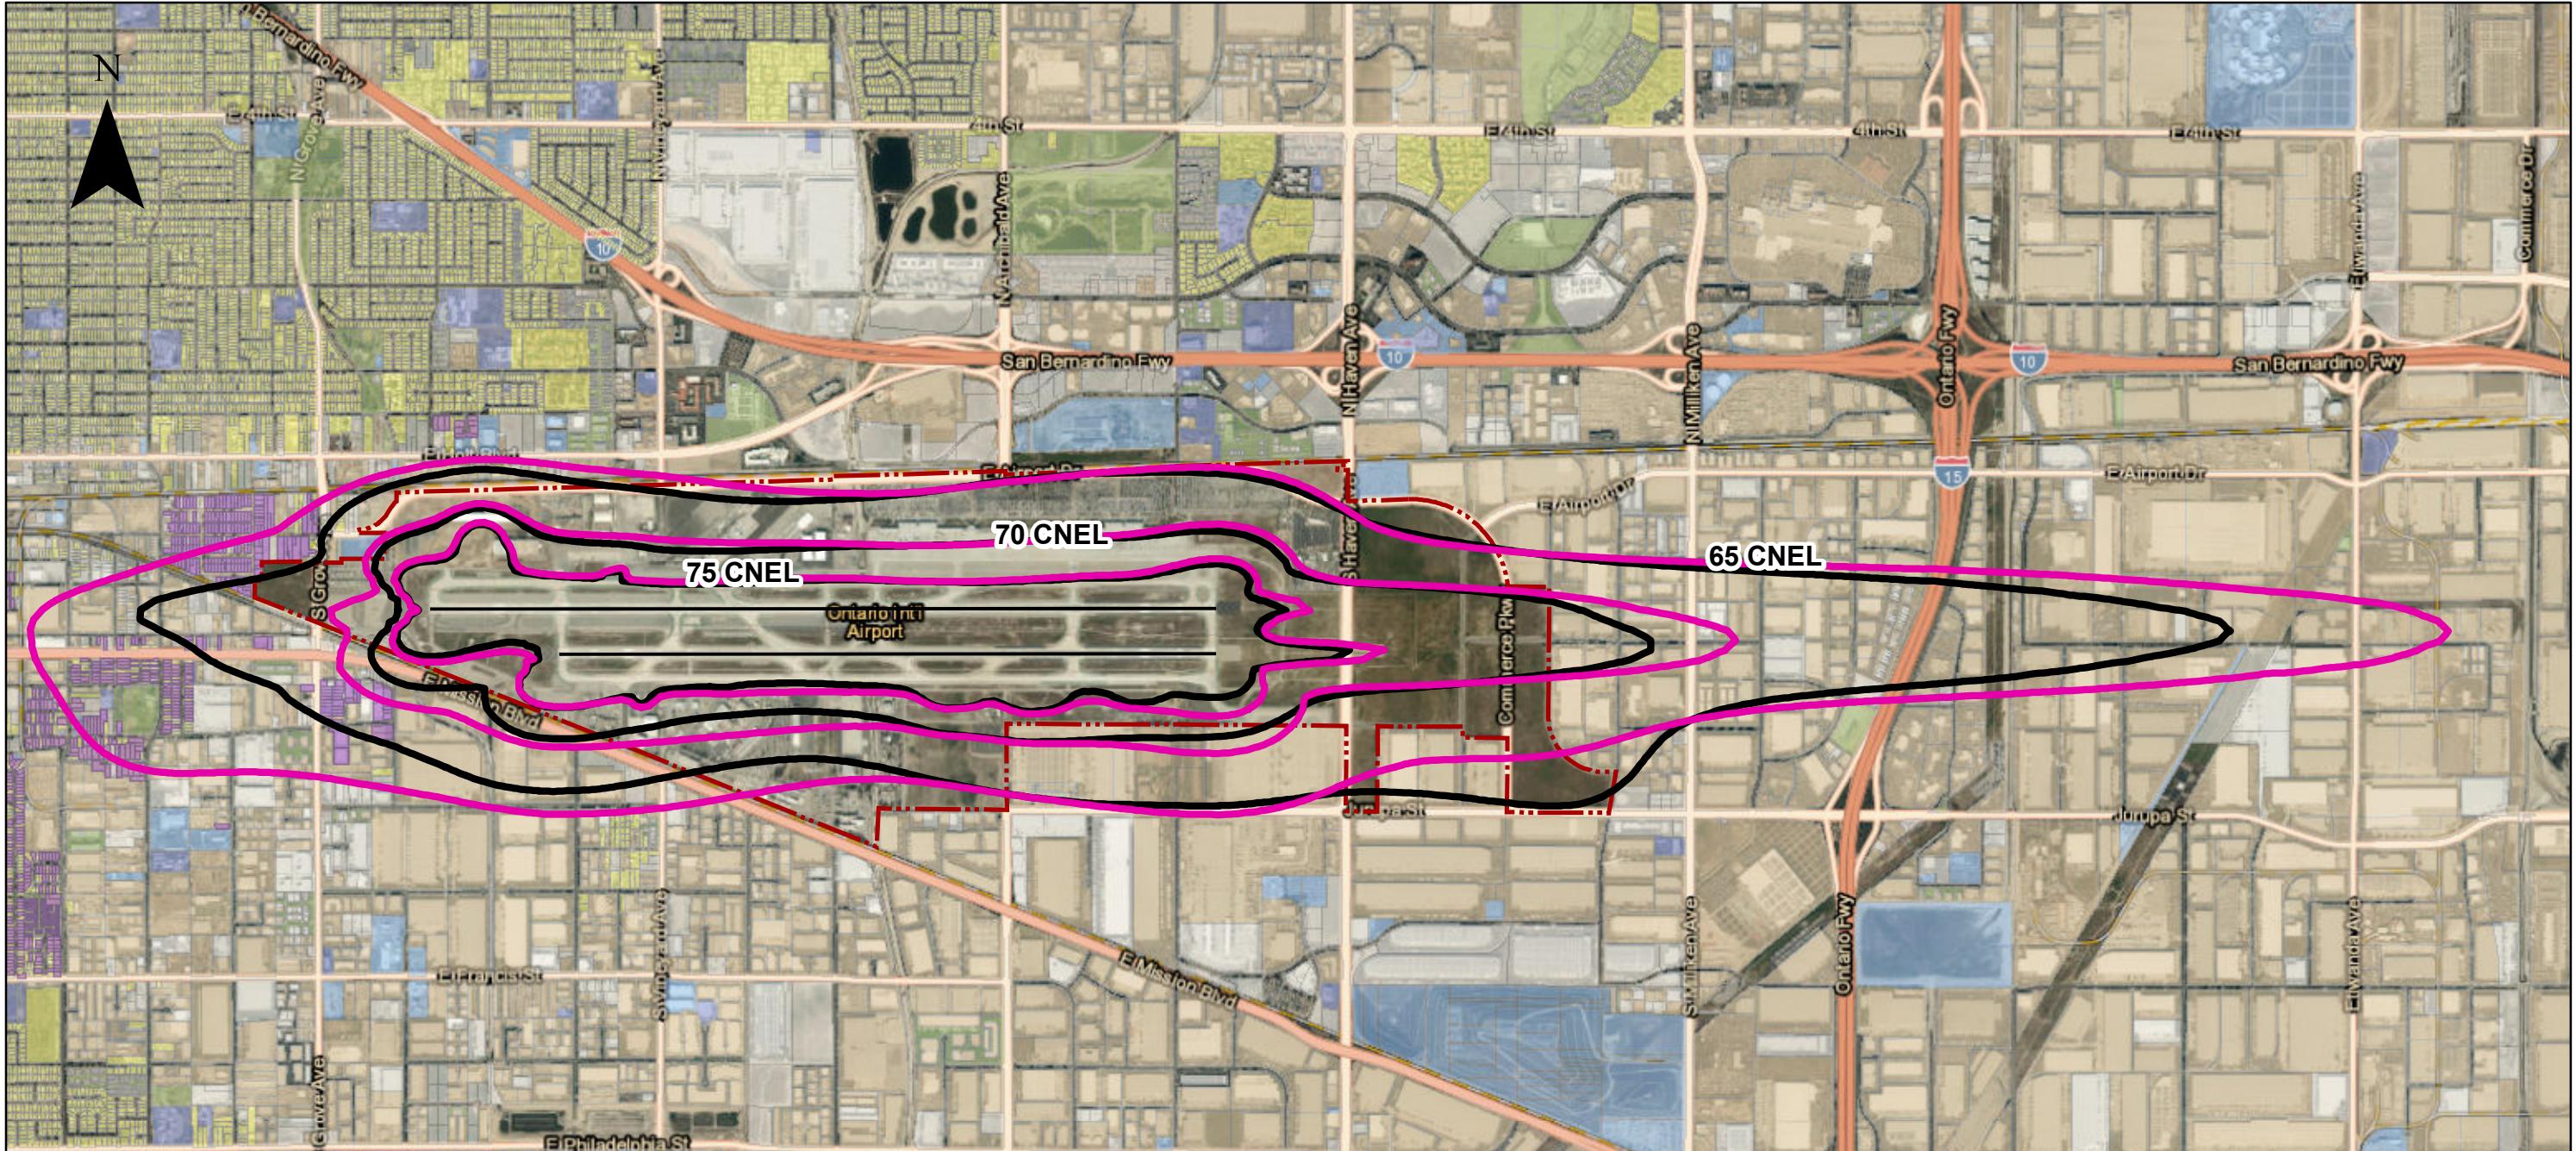

Table 9 provides the estimated number of unmitigated housing units and people within each of the noise contour levels for the Baseline Condition and the Cumulative Projects for the year 2025. As shown, with the Cumulative Projects, it is estimated that there would be 219 additional unmitigated housing units and 991 persons within the CNEL 65-69 dB(A) contour and no housing units or persons within the CNEL 70+ dB(A) contour when compared to the Baseline Condition. Based on these results, in the year 2025 the Cumulative Projects would result in a temporary "potentially significant impact" unless the residences are eligible to be, and are, sound insulated.

Table 9: Housing Units and Population-Cumulative Projects

Year	Condition	Housing Units/ Population	65-69 CNEL	70-74 CNEL	75+ CNEL	Total
2019/2020	Baseline	Housing Units ^a	13	0	0	13
		Population ^a	59	0	0	59
2025	Cumulative Projects	Housing Units ^b	232	0	0	232
		Population ^b	1,050	0	0	1,050
	<i>Increase with Cumulative Projects</i>	Housing Units	+219	0	0	+219
		Population	+991	0	0	+991
